Cooperation between scientists & fishermen:

*Best practices in the Mediterranean*

www.archipelago.gr
www.medreact.org
1. Fishermen working towards recovery of spiny lobster

Sardinia, Italy

- Beginning of 90’s, spiny lobster stocks in Sardinia drastically declined
- Cooperation between fishermen & researchers led to first recovery project in Su Pallosu
- Result: in 15 years, 550% biomass increase
- This led regional government to establish 14 new restocking areas
- The case illustrate in award winning documentary “Little Lobsters”
2. Exchanging information on coralligenous reefs

*NE Aegean islands, Greece*

- Regular destruction of coralligenous reefs by trawling

- Archipelagos researchers & fishermen from Fourni island joined forces to **map coralligenous reefs for the definition of no trawling zones for national authorities**

- Support is sought by DG MARE, RAC/SPA, and other international organisations, to press national authorities to comply with the Mediterranean regulation (Reg.1967/2006) and enforce no trawling zones
3. Crowdfunding campaign: Rewarding sustainable fishermen with nets, *Lipsi island, Greece*

- As fish stocks decline, marine mammals cause increased damage to nets as they hunt for food.
- Less fish available for all but artisanal fishermen are the ones to pay the price.
- Collaboration between Lipsi’s fishermen & Archipelagos resulted in a **crowdfunding campaign to raise funds for selective nets** to compensate fishermen in an area where there has been no deliberate killing of protected species despite the damage they cause to fishing gear.
3. Crowdfunding campaign: Rewarding sustainable fishermen with nets, *Lipsi island, Greece*

**Results**

- The nets given were warmly welcomed by local fishing community who since became more active in showing catches to the research team that records their daily landings.
- Fishermen with higher income did not take their share and kindly offered nets first to poorer families.
- New selective nets also became an invaluable moral support to fishermen, causing a reduction in cases of dolphin entanglement & allowing better relationship between fishermen & marine mammals.

Photo of common dolphin tangled up in trammel nets, taken by fisherman just before he released it alive.
4. Efforts for Monk Seal Conservation

**NE Aegean islands, Greece**

- Collaboration between fishermen of NE Aegean islands & Archipelagos researchers
- Aim: collect information from fishermen on monk seals’ feeding, breeding & resting grounds
5. Efforts for Co-Management

_Lipsi island, Greece_

- Cooperation between fishermen of Lipsi island in NE Aegean and researchers from Archipelagos
- Aim: to create a co-managed Fisheries Protected Area (FPA) around Lipsi
- *Artisanal fishermen raised funds themselves to cover the living expenses of a team of volunteer researchers* and young graduates for over a year on the island, to gather data for the co-management plan
5. Efforts for Co-Management

*Lipsi island, Greece*

- Collecting data on daily catches, fishing areas & methods used & fishing effort
- Long term catch-composition studies for development of sustainable management measures
- Working in close collaboration with local community
6. Combating IUU Fisheries

Archipelagos’ network of local communities and fishermen provide valuable confidential information about IUU activities in their area.
